

# Analyzing Climate Misconceptions and Impact of Misinformation

By Kristina Kuznetsova, Sifan Zhu

# Agenda

01

Motivation

04

Contribution and  
Challenges

02

Dataset

- Climate Fever Dataset

03

Models and  
Methods:

- Analysis of Common Misconceptions
- Sentiment Analysis and Local Explanations
- Evaluation

# 01

## Motivation

## Climate change: Controversial

- Daily experiences, but not straightforward consequences

Misinformation can hinder understanding and action

- How to address climate change effectively?

02

Dataset

# Climate Fever Dataset

Contains challenging claims about climate change and their veracity.

1535 real-world claims regarding climate-change collected on the internet

Each claim: 5 manually annotated evidence sentences (**label:** support, refute or not enough info)

| claim_id   | claim   | claim_label   | evidences/0/evi...   | evidences/0/evi...                                      |
|--|---|---|--|---|
| unique claim id  | claim text  | overall label assigned to claim (based on majority vote on evidences) | unique evidence id   | micro-verdict label                                     |
|  | 1535 unique values  | SUPPORTS 43%<br>NOT_ENOUGH_IN... 31%<br>Other (407) 27%               | Carbon dioxide:192 1%<br>Global warming:276 1%<br>Other (1505) 98% | NOT_ENOUGH_IN... 64%<br>SUPPORTS 27%<br>Other (150) 10% |
| 5  | The sun has gone into 'lockdown' which could cause freezing weather, earthquakes and famine, say sci... | SUPPORTS  | Famine:386   | SUPPORTS  |

A stylized landscape illustration featuring a body of water in the foreground with a small boat. The background includes rolling hills in shades of orange and pink, and a range of dark blue mountains on the right. A small crescent moon is visible in the upper left sky area, and a vertical rectangular frame is on the far left.

03

## Models and methods

## For Claim Classification:

BERT

## For Sentiment Analysis:

\*Fine-tuned BERT model for sentiment analysis.

\*Explanation Method: LIME for generating local explanations.

## Evaluation

Measure the accuracy of misconception identification:

- Accuracy, Precision, Recall, F1-score

Model performance measure:

- K-Fold Cross-Validation

# Contribution and Challenges

## 04

# Challenges:

## **Complexity of Misinformation:**

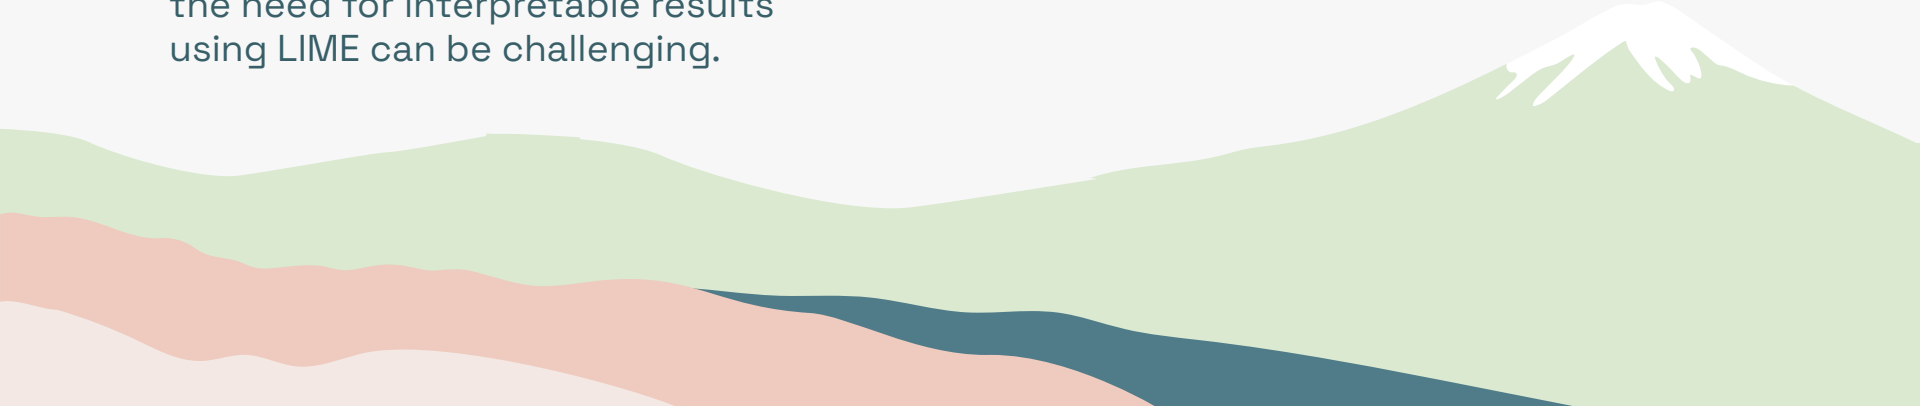

Some false claims may be subtle or context-dependent.

## **Interpretability vs. Performance: :**

Balancing model performance with the need for interpretable results using LIME can be challenging.

## **Public Opinion Data:**

Open source data and surveys may not represent the entire population and could be skewed towards certain demographics or opinions.

# Contribution:

## **Insight into Misconceptions:**

Identify common false claims about climate change.

## **Potential for Awareness and Education: :**

Provide insights for better climate communication strategies.

## **Understanding Public Opinion Shifts:**

Determine how misinformation affects public perception.

Thank you for  
your attention! :)
